

Sunrise Bone & Joint Center

Clinical Note

This is a summary note for Mr. David Thomas Fernandez, a 45-year-old male, who presented following a fall resulting in a comminuted fracture of the right tibial plateau. He underwent surgical fixation on the 5th of June, 2026. Postoperatively he has been started on Tramadol 50mg as needed for pain and Aspirin 75mg once daily. He is to remain partially weight-bearing with crutches for the next four weeks and will be reviewed in clinic in three weeks' time, with repeat imaging prior to that visit.

Note: this record does not include a formally coded diagnosis field or a separate 'surgery type' line -- both are embedded in the narrative above, as is common in dictated clinical notes.
